Transformations in the Coordinate Plane
Goals: *Reflect figures in the coordinate plane across various lines
*Translate figures in the coordinate plane
*Rotate figures around a point by $90^{\circ}$ and $180^{\circ}$
*Dilate figures in the coordinate plane by scale factors
Transformations: changes a figure's size, shape, position or orientation. Original shape is called preimage and coordinates are labeled $A, B, C$, etc. New shape is called image and is labeled $A^{\prime}, B^{\prime}, C^{\prime}$, etc.

| TRANSFORMATIONS |  |  |  |
| :---: | :---: | :---: | :---: |
| Type | Explanation | Symbols/Example |  |
| Reflection FLIP | A transformation in which a figure is reflected (flipped) across a line, creating a mirror image. | If reflecting across the $x$-axis you can use the formula: $(x, y) \rightarrow(x,-y)$ <br> If reflecting across the $y$-axis you can use the formula: $(x, y) \rightarrow(-x, y)$ |  |
| Translation SLIDE | A transformation that shifts a figure vertically and/or horizontally, but does not change its size, shape, or orientation. | Translate $\triangle A B C$ 3 units right and 1 unit down. |  |
| Dilation STRETCH/SHRINK | A transformation that produces an image that is the same shape as the original, but is a different size. <br> A dilation stretches or shrinks the original figure by a scale factor of $k$. | Dilate $\triangle A B C$ by a scale factor of 2 <br> Formula: $(x, y) \rightarrow(k x, k y)$ |  |
| Rotation TURN | A transformation in which a figure turns around a fixed center point. | $90^{\circ}$ counterclockwise around the origin: $(x, y) \rightarrow(-y, x)$ <br> $180^{\circ}$ rotation: $(x, y) \rightarrow(-x,-y)$ |  |

Perform the transformation indicated.

Ex: Reflect $\triangle A B C$ over the $x$-axis.

Ex: Rotate rectangle PQRS by $90^{\circ}$ counterclockwise about the origin

Ex: Translate parallelogram WXYZ 5 units up and 3 units left

Ex: Dilate trapezoid $C D E F$ by a scale factor of 2.

Ex: Rotate $\triangle A B C 90^{\circ}$ counterclockwise about point $B$

Ex: Reflect pentagon RSTUV across the line $x=-1$

Ex: Rotate $\triangle A B C 180^{\circ}$ about point $C$

Ex: Rotate $\triangle A B C 90^{\circ}$ clockwise about point $A$
